ACTUARIAL REVIEW OF THE
2018 ACTUARIAL VALUATION OF THE
FIREFIGHTERS’ RETIREMENT SYSTEM

ACTUARIAL SERVICES
PRESENTED TO THE PUBLIC RETIREMENT SYSTEMS’ ACTUARIAL COMMITTEE
FEBRUARY 25, 2019
February 4, 2019

Mr. Steven Stockstill  
Director and Legal Counsel  
Firefighters’ Retirement System of Louisiana  
Post Office Box 94095 Capital Station  
Baton Rouge, Louisiana 70804-9095

Re: Actuarial Review of the 2018 Actuarial Valuation

Dear Mr. Stockstill:

To fulfill the requirements of R.S. 11:127(C) to the Public Retirement Systems’ Actuarial Committee (PRSAC) for 2018, the Louisiana Legislative Auditor (LLA) has arranged for an Actuarial Review for the Firefighters’ Retirement System (FRS).

In lieu of a Comprehensive Actuarial Review or a Brief Actuarial Review as we have prepared for statewide retirement systems in the past, we are submitting herein an Actuarial Review (AR) for PRSAC’s consideration. The scope of this Actuarial Review is less robust than a Comprehensive Actuarial Review, but provides more specific opinions and recommendations than previous Brief Actuarial Reviews prepared for other statewide retirement systems.

The remainder of this letter contains the results of our Actuarial Review of your June 30, 2018 actuarial valuation (prepared by G.S. Curran & Company and dated November 5, 2018). More specifically, we have evaluated for appropriateness the actuarial assumptions and methods employed by the System and its actuary.

I would like to thank you, your staff, and the board’s actuary for the cooperation and assistance provided for this review.

Sincerely,

Daryl G. Purpera, CPA, CFE  
Legislative Auditor

DGP:JJR:ch

cc: G.S. Curran & Company
Scope of Review

The 2018 actuarial valuation report for the Firefighters’ Retirement System (FRS) for funding purposes was prepared by the actuary for FRS, G.S. Curran & Company, dated November 5, 2018.

This Actuarial Review of that report was prepared by the actuary for the Louisiana Legislative Auditor, Gabriel, Roeder, Smith & Company (under the supervision of Mr. James J. Rizzo), and includes evaluations for appropriateness of key actuarial assumptions and methods.

This Actuarial Review presents documented support for the opinions expressed herein concerning various assumptions and methods employed by the board and its actuary in the 2018 funding valuation. However, a full actuarial valuation replicating the actuary’s results was not performed; nor was a full actuarial valuation performed using recommended assumptions and methods.

This Actuarial Review is limited to discussion of (1) appropriate treatment of FRS’ gain-sharing COLA benefits, (2) appropriate inflation and investment return assumptions, (3) appropriate salary increase assumptions given recent reductions in the assumed rate of inflation, and (4) the actuary’s use of acceptable mortality tables.

Summary of Findings

1. **No Recognition of gain-sharing Cost-of-Living Adjustments (COLAs)**

   The cost of future COLAs is currently not included in the 2018 funding valuation, even though there is a high likelihood that they will be allowed and that they will be granted when allowed. Future COLAs are currently treated by the board and its actuary on a pay-as-you-go basis, recognizing them in the calculations of costs and liabilities only after they are granted.

   Pay-as-you-go funding is not generally acceptable in actuarial practice. The board and its actuary recognize all other future benefits promised by the plan using their respective likelihoods of eligibility and their projected amounts. But the board and its actuary do not recognize any future expected COLA benefits until after they occur.

   Generally speaking, permanent benefit increases (aka COLAs) to FRS members are permitted under the statutes whenever the actual investment returns exceed the assumption, subject to certain timing and other conditions. Numerous statutory rules (return calculation methods, triggers, thresholds, caps, eligibilities, etc.) qualify the FRS board’s permission to grant COLAs. But these rules are all clearly set forth in the statutes, carry no discretion with them, and are calculated by the board’s actuary every year to determine if the FRS board is allowed to grant a COLA that year and, if so, how much may be granted.

   The actuary for the LLA created an actuarial model for measuring the likelihood of the FRS board being allowed to grant a COLA and the maximum amounts allowed during each of the next 30 years, based on those statutory rules. Traditional actuarial experience studies and valuations also measure the likelihood of the FRS board being allowed to grant duty and nonduty disability benefits and their magnitude for each individual employee, the likelihood of death and survivor benefits at each future year for each member, and the likelihood and benefit amount for other plan benefits. It is sound and appropriate actuarial practice to measure the likelihood and magnitude of future expected COLA benefits whenever there are acceptable ways to measure the likelihood and magnitude of COLA benefits. In this case, there is a commonly accepted actuarial method (simulations) for modelling the likelihood and magnitude of future COLA benefits for FRS.
Practically speaking, there are two types of gain-sharing COLAs outlined in statutes for FRS:
- R.S. 11:2260(A)(7) describes “supplemental” monthly cost-of-living adjustments and

Furthermore, the statutes do not permit COLAs to be funded with the balance in a Funding Deposit Account, as with certain other statewide retirement systems. Thus, for FRS if COLAs are to be granted, the only current mechanism is by way of “excess interest” (i.e., “gain-sharing”) described above.

A simulation analysis\(^1\) was conducted by the actuary for the LLA which indicates that, under the terms of the statutes, the FRS board is actuarially expected to be allowed to grant future supplemental and additional COLAs with the frequency and amounts as follows:

<table>
<thead>
<tr>
<th></th>
<th>Supplemental COLA(^a)</th>
<th>Additional COLA(^b)</th>
<th>Total COLA(^b)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Probability of COLA allowed and granted</td>
<td>25.5%</td>
<td>20.0%</td>
<td>20.0%</td>
</tr>
<tr>
<td>COLA rate, given COLA is allowed and granted</td>
<td>2.3%</td>
<td>1.8%</td>
<td>4.1%</td>
</tr>
<tr>
<td>Single equivalent fixed annual COLA rate</td>
<td>0.62%</td>
<td>0.34%</td>
<td>0.96%</td>
</tr>
</tbody>
</table>

\(^a\) For all eligible retirees
\(^b\) For all eligible retirees over age 65

More specifically, the analysis found the following for future supplemental COLAs:

- Supplemental COLAs are expected to be allowed approximately once every three to eight years (averaging one out every four years) over the next 30-year period; refer to first graph below,
- When a supplemental COLA is allowed, the maximum increase is expected to be approximately 2.0% to 2.5% (averaging 2.3%) in eligible members’ benefits, and
- Combining those two distributions, the rate of supplemental COLAs is approximately equivalent to 0.40% to 0.80% (averaging 0.62%) annual COLA; refer to second graph below.

The frequency and amounts of gain-sharing supplemental COLAs for FRS are both (a) predictable and (b) significant, under R.S. 11: 2260(A)(7).

---

\(^1\) A logarithmic distribution with arithmetic means and standard deviations were the same as used in the development of compound 50\(^{th}\) percentiles of future investment returns included in the Joint Board presentation to the Firefighters’ Retirement System, Municipal Employees’ Retirement System and Municipal Police Employees’ Retirement System on July 10, 2018 by the actuary for the LLA. More details of the actuarial model (assumptions and methods) for projecting future returns and the resulting future supplemental and additional COLAs expected are beyond the scope of this Actuarial Review. The LLA’s actuary would be pleased to provide the actuarial methodologies upon request.
Furthermore, the analysis found the following for future additional COLAs:

- Additional COLAs are expected to be allowed approximately once every four to six years (averaging one out every five years) over the next 30-year period; refer to first graph below,
- When an additional COLA is allowed, the maximum increase is expected to be approximately 1.5% to 2.0 (averaging 1.8%) in eligible members’ benefits, and
- Combining those two distributions, the rate of additional COLAs is approximately equivalent to 0.25% to 0.50% (averaging 0.34%) annual COLA; refer to second graph below.

The frequency and amounts of gain-sharing additional COLAs for FRS are both (a) predictable and (b) significant, under R.S. 11:246.

In the actuarial projection model, it was presumed that the FRS board would grant a COLA whenever it is allowed to grant one according to the template. This is a reasonable presumption: (a) given the members are not in Social Security (where COLAs are routinely granted), (b) given the existence of a whole statutory mechanism for paying COLAs, (c) given the trustees’ general desire to pay its members what they are allowed to pay, (d) especially if it has been a while since the previous COLA was granted to them (now four years since the last COLA), and (e) especially when other retirement systems and Social Security have granted COLAs (“me too” pressure).

It was further presumed that, in those situations, the FRS board will grant the maximum allowed (both supplemental and additional COLAs, to the extent there is gain-sharing earnings available). One might say that only one type of COLA would be granted, not both. But it does not seem reasonable to say that one cannot know whether any COLAs would be granted on a predictable basis and, therefore, fail to recognize any future COLA benefits.

If the additional cost and liability for recognizing future expected COLAs were not material, the actuary for the LLA would not recommend including them in the valuation. However, in this case, the additional unrecognized cost and liability is significant. Consequently, a significant benefit is not being valued.

The cost and liability for future expected COLA benefits can be approximated with this model and recognized in the regular annual valuation to improve the board’s public representation of the system’s costs and liabilities.

We recommend that the FRS board (a) engage its actuary to model the likelihood and dollar amounts of future cost-of-living increases funded with “excess” investment earnings, as permitted by the statutory template and (b) incorporate permitted future cost-of-living increases in the measurement of the plan’s costs and liabilities.
2. **Overly Optimistic Return Assumption.**

An important building block component in the determination of a system’s investment return assumption is the expected rate of future inflation. The board’s inflation assumption for the 2018 funding valuation is 2.70% per year. This inflation assumption is an outlier and is higher than all eight professional inflation forecasting organizations researched\(^2\) by the actuary for the LLA (representing over a hundred inflation forecasting specialists). A consensus of the mainstream inflation assumptions (from these national reputable sources) would be approximately 2.25% for a 10-year horizon and 2.40% for a 30-year horizon.

The investment return assumption used in the board’s 2018 funding valuation is 7.30% per year. This investment return assumption is also an outlier and outside the mainstream of 13 professional investment forecasting organizations obtained by the LLA’s actuary. It is overly optimistic considering FRS’s: (a) own asset allocation and (b) its own expected cash flow. Note this is not just the opinion of actuary for the LLA, but is the consensus opinion of 13 major national and independent investment consultants and investment managers, whose capital market assumptions were applied with full transparency and understanding to FRS’s own asset allocation and expected cash flow.

Considering the fund’s own asset allocation, a more appropriate net return assumption would be 5.9% per year for the next 10 years or 6.6% per year for the next 27 years\(^3\).

</tbody>
</table>

Considering, further, the fund’s expected cash flow would put the most appropriate assumption at approximately 6.3% - in between the 5.9% expectation for a 10-year horizon and the 6.6% expectation for a 27-year horizon.

This is 100 basis points lower than the board’s 2018 assumption. Even though the board lowered the return assumption from 7.5% to 7.4% to 7.3% (2016 to 2017 to 2018 funding valuations, respectively) with a stated goal of reaching 7.0% in 2021, the current 7.3% is still overly optimistic compared to subject matter experts. All valuation assumptions need to stand on their own each year.

Even considering a reasonable range around the 6.3% most appropriate rate (e.g., 50 basis points above and below), the current 7.3% is still overly optimistic.

---

\(^2\) For the backup research supporting this assertion, please refer to the Appendix “Basis for Inflation Assumption” in each of the 2018 valuation reports for the four Louisiana state retirement systems, as prepared by the actuary for the LLA.

\(^3\) For the backup research supporting this assertion, please refer to the Joint Board presentation to the Firefighters’ Retirement System, Municipal Employees’ Retirement System and Municipal Police Employees’ Retirement System on July 10, 2018 by the actuary for the LLA.
We recommend the board lower its return assumption significantly more than its current policy of ramping down by 10 basis points each year. A significant reduction is needed in order to (a) bring it into the mainstream of professional forecasters and (b) produce a more appropriate representation of the system’s costs and liabilities.

3. **Salary Scale and Inflation Inconsistency.**

The assumed rate of inflation is also an important building block in a pension valuation’s assumption concerning salary increases for individual members.

In each of the two most recent funding valuation reports (2017 and 2018), the board’s assumption for inflation dropped by 0.10% and 0.075% from the prior year, respectively. However, the salary increase assumption did not drop by similar levels. No parallel change was made in tandem to the salary increase assumptions. This makes the salary increase assumption inconsistent with the embedded inflation assumption.

<td>None</td>
</tr>
</tbody>
</table>

If the board had lowered the salary increase assumption to be consistent with lowering the inflation assumption for the 2017 and 2018 valuations (decreasing effects), these would have been perfect opportunities to partially offset the effects of even lower and more mainstream return assumptions for 2017 and 2018 (increasing effects). This way, the return assumption could be lower than 7.3% by now, with less impact on the contribution and liability levels.

---

4 Actuarial Standard of Practice (ASOP) No. 27, section 3.12 states:

*Consistency among Economic Assumptions Selected by the Actuary for a Particular Measurement—With respect to any particular measurement, each economic assumption selected by the actuary should be consistent with every other economic assumption selected by the actuary for the measurement period, unless the assumption, considered individually, is not material, as provided in section 3.5.2. A number of factors may ASOP No. 27—September 2013 14 interact with one another and may be components of other economic assumptions, such as inflation, economic growth, and risk premiums. In some circumstances, consistency may be achieved by using the same inflation, economic growth, and other relevant components in each of the economic assumptions selected by the actuary. Consistency is not necessarily achieved by maintaining a constant difference between one economic assumption and another. For each measurement date, the actuary should reevaluate the individual assumptions and the relationships among them, and make appropriate adjustments.*
4. **Mortality Assumption.**

The 2018 Actuarial Valuation (page 42) states that the mortality assumption for annuitant and beneficiary mortality is the “RP 2000 Combined Healthy with Blue Collar Adjustment Sex Distinct Mortality Tables Projected to 2031 using Scale AA”

To evaluate the reasonableness of the mortality assumption, we reviewed the base mortality (RP2000 with Blue Collar Adjustments) separately from the projection scale (Scale AA). We believe the use of the RP2000 with Blue Collar Adjustments as the base mortality table to be reasonable. Therefore, we find the base table (before projection for future mortality) to be fully appropriate for the 2018 Actuarial Valuation.

Once the base table was found to be reasonable, we then reviewed the projection scale used in the mortality assumption (projection Scale AA). We believe the actuary’s use of Scale AA projected to 2031 is not unreasonable.

A more current approach to estimating mortality rates for valuation purposes would be to use either: (a) RP2000 projected generationally by Scale BB or (b) RP2014 loaded with 120% (for CDC data) and adjusted for partially credible plan-specific experience, then projecting generationally using MP2017 or MP 2018. Blue Collar adjustment would also be reasonable for each. While either of these two approaches would be more current and preferable methodologies, we do not find the mortality tables used in the FRS 2018 actuarial funding valuation report to be unreasonable.
Actuarial Certification

This report is considered to be a Statement of Actuarial Opinion. We therefore make the following certification:

This report has been prepared by actuaries who have substantial experience valuing public employee retirement systems. All calculations have been made in conformity with generally accepted actuarial principles and practices, and with the Actuarial Standards of Practice issued by the Actuarial Standards Board.

We, James J. Rizzo and Piotr Krekora, are Consultants and Actuaries with Gabriel, Roeder, Smith & Company, the current actuary for the Louisiana Legislative Auditor. We are members of the American Academy of Actuaries, Associates in the Society of Actuaries, and Enrolled Actuaries, and we meet the Qualification Standards of the American Academy of Actuaries necessary to render the actuarial opinions contained herein.
